Abstract Of The Disclosure

The present invention relates to a low sodium, low linting, and low streaking hydroentangled nonwoven fabric formed from a synthetic fiber and a cellulosic fiber, which may be utilized as a wipe. The fabric is free any surfactants that may have a negative impact on the sodium ion particulate count. Further, the fabric is exposed to an acid wash that extracts a vast majority of the sodium ions. The resultant hydroentangled nonwoven fabric not only exhibits excellent drape, hand, strength and absorbency, it also low linting, low streaking, and exhibits a low sodium ion count, particularly suitable for use in consumer wipe applications.
